TOILET TRAINING FOR CHILDREN WITH SPECIAL NEEDS

Toilet training is an important milestone for all children and their parents, but can be a difficult skill to master, even for typically developing children. **Toilet training is an important step in personal independence**, which opens up opportunities for taking part in a wider range of activities. In addition, there are practical benefits for caregivers, including time and financial savings connected with the cost of diaper changing.

Children with special needs often face additional challenges with toilet training. Children with physical disabilities may need adaptive equipment, which their occupational therapist or physical therapist can help with. Children with cognitive impairments or other developmental disabilities may need behavioral approaches that break the process down into manageable steps. Children with sensory sensitivities need help dealing with these impediments. **There are many resources available**, often directed toward the needs of children with autism but usually relevant for children with any developmental delays.

When considering toilet training, parents need to consider several factors, including signs of readiness, special challenges their child may face, and the need to coordinate an approach across all of the child’s environments (i.e. home, childcare, school).

Toileting readiness skills:

- **Age**: mental age over about two years
- **Awareness**: of being wet, of toileting routines, of needing to go
- **Physiologic factors**: dry periods, regular bowel movements
- **Motor skills**: can they sit up, get on the toilet, and manage clothing?
- **Medical**: are there medical issues that contraindicate toilet training? (for example, constipation)

Challenges to toilet training for children with special needs:

- Communication problems
- Sensory issues: awareness of needing to void; aversions to bathroom noises like toilet flushing
- Sensitivity to overstimulation
- Need for routine
- Motor planning problems
- Deficits in imitation skills
- Increased anxiety
- Problems with generalization and maintenance

When parents are interested in working on toilet training, the first step is to assess readiness and to look at the process from the perspective of their child to identify potential impediments. If they believe their child is ready, the next step may be to **keep a toileting chart** and use it to capture information about the timing of their child’s urination or bowel movements each day. This will provide information about appropriate times to take the child to the toilet as well as to figure out how to break the task down into small steps that can be individually taught. **Set realistic goals**, understanding that each step toward independent toileting is a goal in itself. **Visual supports** can be added to clarify steps and expectations and to build positive routines. If their child is in school, they can also work with the special education teacher, both for advice and to ensure that the approach is coordinated between home and school. Toileting goals can be added to the IEP.
HABIT TRAINING is a structured approach that can be used when parents have not been successful with a more casual approach. It uses systematic procedures, begins with intensive up-front training, and must be coordinated across all settings, with all caretakers involved. There are books and online resources available to parents who want to use this approach. A referral to a psychologist or behavior analyst with expertise in habit training may be especially helpful for parents of children with autism or cognitive impairments, who have struggled with toilet training.

Habit training: When to use it
- When you want to train quickly (2 days)
- When child has not learned from other techniques
- When awareness of need to void is limited or not present
- Child does not demonstrate awareness of soiled diapers or clothes
- When a child is 5-6+ years old and not yet trained, and has a mental age of 2-4 years

- Remember: Provider One Medicaid can be used to pay for diapers for children over age 3 that have a condition that causes them to be incontinent. More information is available on the criteria and process by going to the CSHCN Program website: www.kingcounty.gov/health/cshcn and select the Paying for Diapers with Provider One document.
